

ACKNOWLEDGEMENTS

During my three years as a graduate student at Cheng Chi University, professors, classmates, friends, and my family have helped me in more ways than I can relate. This research would never have been possible without their steadfast support and encouragement.

First and foremost, I would like to express my deepest appreciation toward my thesis advisor, Dr. Chi-yee Lin. I thank him not only for inspiring me to think clearly and critically but also for offering invaluable advice on the development of this thesis. His never-ending patience for reading my drafts and willingness to offer thoughtful comments merit much more gratitude than I can possibly express here.

I am also indebted to my committee members: Dr. Vincent Wuchang Chang and Dr. Chin-chi Chao for their insightful and thoughtful questions, suggestions, and comments, which have helped me to further revise and improve my thesis. Equal gratitude is extended to Dr. Pao-cheng Lin, professor at the Taipei Physical Education College, who assisted me in statistic processing, and to Dr. Po-ying Lin for her enthusiastic guidance throughout the years of my graduate study.

Among my classmates and friends, I owe sincere thanks to Jill Lin and Cindy Zeng for the constant cheer they provided, and especially to Cindy for encouraging me to take the graduate entrance examination, which made my study here at Chengchi University a possibility.

Last but not least, I am especially grateful to my parents and husband for their unflagging and unconditional love and understanding. My gratitude also goes to my two daughters for the emergency word processing assistance they provided and for their assurances to their friends that their mother would finish her graduate courses without fail. Their confidence in their mom provided valuable momentum for me to finish my courses

and thesis. Without them, all my dreams would never have come true.
